ABSTRACTED-PUB-NO: TW 290774A
BASIC-ABSTRACT: The automatic telephone dialler consists a telephone number
storage card which is incorporated in a business card and a card reader. The
card reader is capable of reading voice information which is stored in the
telephone number storage card and is able to automatically dial the telephone
number, just by inserting the card reader in the telephone. The telephone
number storage card is installed on a chip or tape which is used to store a
telephone number tone signal.

When the telephone number storage card is inserted into the
insertion slot in
the card reader, a probe contacts the chip on the telephone
number storage
card. The working current supplied by the power source and
voice signal stored
in the chip enable transmission via a power line. The
telephone auto-dialing
function is then achieved by using the amplified signal
from the amplifier to
the drive speaker to generate a voice signal.

USE - E.g. for automatically dialling phone number on
business card.
